

CRM Order, Commission and Payout Operations Report

How the platform works today, what runs end to end, and where staff input is still required.

REPORT DATE	SCOPE
24 August 2026	CRM, orders, commissions, payouts, operational handoffs

Current verification: Database support for shared CRM reminders, staff activity, inquiry ownership, completion-email status, and payout settlement is active. Application changes are implemented in the current codebase and become production behavior with the corresponding application release.

1. Executive view

The platform operates as a sales CRM and order operations system rather than a fully automated ERP. It captures customers and leads, keeps the order ledger, applies sales attribution, calculates commissions, and produces payout records. Money movement, carrier booking, and several operational decisions remain human-controlled.

Overall assessment

The core commercial record is connected end to end: a customer or staff-created order can be priced, validated, stored, attributed, included in commission reporting, approved for payout, and recorded as paid. The two main boundaries are external execution: collecting or verifying certain payments, and physically sending money or parcels.

Operating area	Current position	Status
Customer and lead records	Built from orders, leads, carts and inquiries, with shared reminders and staff activity.	Running
Storefront order entry	Catalog selection, live pricing, promo checks, inventory reservation and order storage are connected.	Running
Staff order entry	Manual customer and shipping input, with server-controlled pricing, promo, stock and attribution.	Implemented
Commission calculation	Paid-order eligibility, agent attribution, variable rates, salaries and overrides are calculated by the platform.	Running
Payout settlement	Approval and evidence are recorded; the actual bank/SINPE/PayPal transfer is made outside the platform.	Hybrid
Fulfillment	Order status and tracking are stored; parcel preparation and tracking-number creation happen outside the platform.	Manual

What the CRM is responsible for

- Maintaining the working customer, lead, inquiry and order records.
- Keeping pricing, promotion, inventory, sales-agent and affiliate attribution consistent.
- Showing which orders qualify for commission and what each person earned.
- Creating an approval trail and settlement record for team and affiliate payouts.
- Keeping notification outcomes visible enough for staff to retry failed completion emails.

2. How the platform works as a CRM

The CRM is centered on contact identity and commercial activity. Customers are not maintained as a separate isolated address book; their profile is assembled from the records the business already uses to sell and support them.

CRM source	What enters the record	How staff use it
Orders	Customer name, email, phone, shipping details, products, total, status and credited agent.	Purchase history, lifetime value, repeat-customer recognition and sales ownership.
Catalog leads	Name and available contact details, source, notes, status and sales-agent ownership.	New-sales follow-up, claiming, assignment and conversion.
Abandoned carts	Contact details, cart items and recovery activity.	Recovery outreach and conversion monitoring.
Customer inquiries	Name, email, subject, message, status and shared owner.	Reply, assign, open customer profile, create a lead or prefill an order.
Shared CRM workspace	Follow-up reminder, due date, activity entry, staff actor and completion state.	Team-visible follow-up and a common customer activity trail.

Customer ownership and handoff

- **Historical ownership:** when an order has no referral or assigned agent, the platform can return the customer to the eligible agent who first closed them.
- **Inquiry ownership:** assignment is saved in Supabase, so the owner is shared across browsers and staff accounts.
- **Inquiry conversion:** Order opens a prefilled manual-order form; Lead creates or updates the CRM lead instead of leaving data in browser-only storage.
- **Follow-up continuity:** reminders and staff activity now live in shared database tables rather than one browser local-storage record.

CRM operating model

The platform records and coordinates work. A staff member still decides who should respond, what to say, when to follow up, and whether a conversation is ready to become a lead or an order.

3. How orders enter and move through the platform

There are three practical order-entry paths. All of them converge on the same Supabase order ledger, but the amount of staff input differs by channel.

Entry path	Entered by staff/customer	Handled by the platform
Storefront checkout	Customer identity, shipping address, cart, promo and payment choice.	Rebuilds prices from current product rows, validates promo conditions, applies live CRC/USD rate, adds earned BAC gift, saves the order, reserves stock and starts notifications.
Manual order	Staff enters customer/contact details, selects products and quantities, enters shipping, payment method and starting status.	Ignores typed prices as authority; confirms catalog price, live FX, promo eligibility and usage, inventory, customer history attribution and normal alerts.
Inquiry to order	Staff clicks Order after reviewing the inquiry, then completes missing order details.	Carries name, email and extracted phone into the manual-order form and follows the same protected save path.

After the order is saved

- The order receives a unique order number, source, currency totals, customer details, canonical items and an activity trail.
- Inventory is reconciled against the order, including the free BAC gift line, and low-stock notifications are raised when thresholds are crossed.
- Pricing edits use the current live rate and current product catalog. Items, shipping and discounts are locked after an order is paid or completed.
- Completing an order sends the customer completion email and accounting copy. The result is stored as sending, sent, partial, failed or skipped.
- Saving tracking on an already completed order triggers the completion email again; staff can also use Send / resend email from the order detail panel.

4. How commissions are calculated

Commission is calculated from the order ledger, not typed onto a weekly statement. The scan and approval routes re-check the underlying orders so pending or ineligible sales are not paid by mistake.

Calculation stage	Rule used
Order eligibility	Only orders with Paid, Completed, Order Complete or Partly Refunded status enter commission calculations.
Agent match	The order sales_agent value is matched to the staff profile by name, email or normalized key.
Sales value	The platform reads total_usd and total_crc and fills the secondary currency using the current guarded exchange rate when required.
Rate selection	An order-specific override takes priority; otherwise the agent profile commission rate is used.
Agent commission	Eligible order sales value x applicable percentage, calculated per order and then summarized.
Weekly salary	Configured salary is converted into both currencies and added to commission.
Sub-user split	An active sub-user normally earns 8%; the parent staff member receives a 2% override. The combined cost remains 10%.
Agent referral	A sales-agent affiliate referral can use the combined 20% agent-referral rate and does not also create a separate affiliate payout.
External affiliate	Affiliate commission is calculated using the affiliate stored rate and the eligible commission base recorded on the order.
Duplicate protection	Orders already reserved by Approved, Payment Initiated, Paid or Failed payout records are excluded from later scans.

Commission formula

Agent payout = order commission + weekly salary + eligible sub-user override.

The report stores the contributing orders and per-order rate so the displayed statement can be traced back to the source sales.

Control at approval

- The current statuses of saved orders are refreshed before approval.
- Amounts are recalculated before the payout is marked Approved.
- The statement email result is stored as sent or failed.
- The accounting copy is handled separately so one bad recipient address does not erase the financial record.

5. How approvals and payouts work

Approval confirms the amount owed. Settlement records what happened to the actual transfer. These are deliberately separate states so an approved invoice cannot be mistaken for money that has already left the business.

State	Meaning	Required evidence / next action
Pending	Calculated payout is waiting for review.	Review included orders, rates, salary, overrides and totals.
Approved	Amount and recipient are approved; statement email is attempted.	Choose payment channel and begin the external transfer.
Payment Initiated	The transfer has been started outside the platform.	Record method; reference and receipt URL can be added when available.
Paid	Transfer is confirmed and the payout is closed.	Payment method and reference are mandatory; paid_at and recorder are saved.
Failed	Transfer attempt did not complete.	Failure reason is mandatory; record can be retried through settlement.
Rejected	Payout was not approved.	No settlement should be recorded.

What is automated

- Preparing the payout amount from eligible orders.
- Rechecking orders and recalculating the statement at approval.
- Sending the statement and recording the email outcome.
- Preventing settled or reserved orders from appearing as unpaid again.
- Recording the method, reference, receipt URL, notes, failure reason and settlement timestamps.

What remains external

- The bank, SINPE or PayPal transfer is executed outside the CRM.
- Staff confirms the external result and records Payment Initiated, Paid or Failed.
- A receipt can be linked, but the CRM does not pull settlement confirmation directly from the financial provider.

6. End-to-end operating coverage

This matrix separates complete internal flows from hybrid flows that cross into payment, banking, shipping or human judgment.

Workflow	Entry	Processing	Completion	Coverage
Storefront order	Customer checkout	Price, promo, FX, stock, attribution and order save	Order created and notifications attempted	End to end
Manual order	Staff customer/order input	Authoritative price, promo, FX, stock and attribution	Order created and alerts attempted	Implemented
Inquiry conversion	Staff clicks Lead or Order	Contact is persisted or used to prefill the order	Lead/order record continues in its destination workflow	Implemented
CRM follow-up	Staff creates reminder	Shared reminder and activity are stored	Staff marks complete	Hybrid
Completion email	Order becomes complete or tracking is added	Customer and accounting sends are attempted	Delivery state and error are saved; manual resend available	End to end
Agent commission	Staff starts scan	Eligibility, rates, salary and overrides are calculated	Owner approves and statement is recorded	Hybrid
Affiliate commission	Staff starts scan	Eligible affiliate orders and stored rate are calculated	Owner approves and statement is recorded	Hybrid
Payout transfer	Approved payout	Staff sends money outside CRM	Reference and Paid/Failed outcome are recorded	Manual boundary
Shipping	Paid/processing order	Staff packs and books shipment outside CRM	Tracking is entered and customer is notified	Manual boundary

Practical meaning of end to end

The platform can finish its own recordkeeping and calculation stages. It does not currently replace a payment processor, a banking portal, Correos fulfillment tools, or the staff judgment needed to sell and support customers.

7. Current dead ends and manual-entry points

A dead end is a stage where the CRM has the record but cannot perform the next external or scheduled action by itself. A manual-entry point is a deliberate place where staff supplies information or makes a decision.

Dead ends

Point	What happens now	Operational effect	Recommended improvement
Non-card payment reconciliation	SINPE, PayPal and other manual payments are checked outside the CRM.	Status depends on staff confirmation; delays can leave orders pending.	Add provider webhooks or a reconciliation import with unmatched-payment review.
Manual-order card payment	Manual card orders begin as Payment Pending and require a payment link or external verification.	The order exists before the payment outcome is final.	Connect payment-link status directly to the order and surface automated success/failure.
Shipment creation	Staff obtains the Correos tracking number outside the platform.	The CRM cannot produce a label, book the shipment or know carrier status on its own.	Integrate Correos label/tracking APIs or a structured shipment import.
Payout transfer	Team and affiliate money is sent through a bank, SINPE or PayPal outside the platform.	The CRM can prove settlement but cannot initiate or confirm the transfer automatically.	Add a supported payout provider integration with webhook confirmation.
CRM reminder delivery	Reminders are shared and visible, but completion depends on staff opening the CRM.	An overdue reminder does not independently send a push, email or WhatsApp alert.	Add a scheduled reminder worker and escalation rules.
Completion-email retry	Failures are stored and staff can resend from the order.	A failed send waits for human retry.	Add a retry queue with limits, backoff and an unresolved-failure dashboard.
Inventory replenishment	Orders deduct stock and low-stock alerts are created, but purchase/reorder activity is external.	No purchase order is created automatically when stock falls below threshold.	Add supplier, reorder quantity and purchase-order workflow.

8. Manual-entry register and recommended priorities

The following inputs remain part of normal daily operation. They are not calculation weaknesses, but each should have a clear owner and validation rule.

Area	Manual input or decision	System control already present
Inquiry handling	Choose owner, write response, decide whether to create a lead or order.	Shared ownership and direct conversion handoff.
Manual orders	Customer/contact details, products, quantities, shipping, payment method and initial status.	Catalog pricing, live exchange rate, promo validation, stock and attribution.
Payment review	Confirm external SINPE/PayPal/manual-card outcome.	Order status, payment details and activity are stored.
Fulfillment	Pack parcel, book carrier, enter tracking number.	Tracking activity and completion-email trigger.
CRM follow-up	Create reminder, perform contact, mark reminder complete.	Shared reminder and activity history.
Commission run	Select period and start team or affiliate scan.	Eligibility, rates, totals, duplicate protection and statements.
Payout approval	Review and approve or reject calculated payout.	Recalculation at approval and email outcome tracking.
Payout settlement	Execute transfer and record method, reference, receipt or failure reason.	Controlled settlement states and immutable Paid record.
Inventory management	Receive stock, update counts and respond to low-stock notice.	Automatic order deductions and threshold alerts.
Promo administration	Create code, choose dates, rate, unit limits and product scope.	Checkout and manual-order validation and usage increment.

Recommended order of improvement

1	Payment reconciliation	Reduces pending-order delay and removes repeated transaction checking.
2	Carrier integration	Removes double entry and gives the CRM a true fulfillment status.
3	Automated reminder and email retry workers	Turns visible exceptions into actively managed queues.
4	Payout-provider integration	Closes the last financial handoff after approval.
5	Replenishment workflow	Connects stock warnings to supplier action and purchase records.

Conclusion

The platform already performs the difficult internal controls: authoritative order pricing, shared CRM records, attribution, commission calculation, approval and settlement evidence. The remaining work is concentrated at external service boundaries and scheduled exception handling, not in the core sales ledger.
