

OPERATIONS REVIEW

CRM, Order & Commission Operations

Current platform workflow and verified live operating snapshot

Executive summary. I reviewed the current platform and the live operating data to document how the CRM, order entry, sales attribution and commission workflows are working today. The system is operating as an order-centered CRM with active public checkout, manual order entry, commission generation and superadmin approval.

Verified live snapshot

736 TOTAL ORDERS	719 ASSIGNED TO AN AGENT	599 COMMISSION-ELIGIBLE
193 PAYOUT RECORDS	37 APPROVED PAYOUTS	170 CARD ORDERS

What the platform covers today

- Customer management: profiles are built from orders, leads, abandoned carts and customer contact activity.
 - Order operations: public checkout and staff-entered phone or WhatsApp orders are stored in one order system.
 - Sales ownership: orders can be assigned through referrals, customer history or staff assignment.
- Commission accounting: eligible orders are calculated using the applicable agent rate, salary and adjustments.
 - Payout approval: weekly payout records can be reviewed, recalculated and approved by a superadmin.
 - Reporting: approved payouts retain their covered orders, calculated values and invoice snapshot.

Review basis: Current application code and a read-only production data check completed on August 24, 2026. Live counts may increase as new orders and payout records are added.

01

CRM and customer ownership

The CRM builds a practical customer view from the activity already happening across the business. Orders, catalog leads, abandoned carts and contact activity are brought together so staff can review purchase history and continue customer conversations from one place.

Customer matching

- Email address is used as the primary customer identifier.
- Phone numbers are normalized so common Costa Rican formats can be matched consistently.
- The customer view consolidates order value, status, contact details and activity.

Sales ownership

- A valid direct referral is respected for the incoming order.
- When no referral is present, returning-customer history can restore the original sales owner.
- 51 orders in the live data were automatically attributed through customer history.

02

How orders enter the platform

ORDER CHANNEL	CURRENT WORKFLOW
Public catalog checkout	Validates customer details, rebuilds totals from current product pricing, checks promotions, applies volume rules and free BAC-water items, resolves attribution, deducts inventory, records the order and triggers the normal customer and team notifications.
Card checkout	Creates a pending order and updates the result through ShieldHub Pay or its webhook. The live dataset contains 170 card orders.
WhatsApp, PayPal and SINPE	Creates the order for staff follow-up and payment confirmation through the CRM.
Manual CRM entry	Allows staff to enter phone or WhatsApp orders, apply the configured volume pricing, add earned BAC-water lines, assign ownership and clear matching abandoned-cart records.

Live currency handling. Manual CRM orders now use the same guarded, database-backed USD/CRC exchange rate as customer checkout. The current rate is shown in the form, and the server recalculates the USD and CRC totals again before saving the order.

At the time of verification, the stored rate was USD 1 = CRC 451.035, sourced from CurrencyFreaks. The platform refreshes the rate automatically and applies its configured validation and freshness controls.

03

Team commission calculation

Commission is calculated from orders that have reached an eligible sales status: Paid, Completed, Order Complete or Partly Refunded. The calculation uses each order's applicable rate and keeps USD and CRC as two currency views of the same payout.

Net eligible order value	x	Applicable commission rate
+ Weekly salary	+	Parent override, when applicable
- Refund adjustment	=	Approved payout value

Rate selection

- The standard rate comes from the staff profile.
- An order-specific rate can be applied when required.
- Qualified referral and self-generated sales can use the configured 20% combined agent rate.

Payout values

- Refunded value is deducted before commission is finalized.
- Weekly salary and eligible parent overrides are included in the same payout record.
- USD and CRC totals are presented as equivalent values, not added together.

04

Weekly payout workflow

1	Weekly scan Runs every Monday at 08:00 Costa Rica time for the selected period.	2	Eligibility check Selects eligible orders and excludes orders already settled for the same agent.
3	Calculation Builds commission, salary, override and adjustment totals using the current exchange rate.	4	Pending record Creates or refreshes the payout record for superadmin review.
5	Approval Refreshes the covered orders and recalculates the final amount before approval.	6	Statement Stores the final order evidence and invoice snapshot, then attempts email delivery.

Live operating evidence. The platform contains 193 team payout records and 37 approved payouts. Every approved payout checked includes its covered orders, an approval timestamp and a generated statement snapshot. The reviewed records showed no duplicated approved agent periods and no order paid twice to the same agent.

Accounting handoff: Approval records the final commission amount and prepares the supporting statement. The actual transfer of funds is completed through the company's existing accounting and payment process.
